1 Introduction

1.1 ST Reference

Title	Version	Document number
nShield Solo XC HSM Security Target	1.1.1	LSEC0579

1.2 TOE Reference

nShield Solo XC Hardware Security Module v12.60.15

1.3 TOE Overview

1.3.1 TOE Type

The TOE is a Hardware Security Module (HSM) in PCIe board form factor.

1.3.2 TOE Description

The nShield Solo XC Hardware Security Module (HSM) is a general purpose Cryptographic Module which comes in a PCI express board form factor protected by a tamper resistant enclosure. It performs encryption, digital signing, and key management on behalf of an extensive range of commercial and custom-built applications including public key infrastructures (PKIs), identity management systems, application-level encryption and tokenization, SSL/TLS, and code signing.

The nShield Solo XC HSM is also embedded inside the nShield Connect XC, which is a network-attached appliance delivering cryptographic services as a shared network resource for distributed applications and virtual machines, giving organizations a highly secure solution for establishing physical and logical controls for server-based systems.

Figure 1 nShield XC HSM

Figure 2 nShield Connect XC

The TOE comprises the following:

Type	Name	Identifier	Form factor	Delivery
Hardware	nShield Solo XC F2	nC3025E-000 rev 06	PCIe board	Courier
	nShield Solo XC F3	nC4035E-000 rev 06	PCIe board	Courier
	nShield Solo XC for nShield Connect XC	nC4335N-000 rev 06 This module is embedded in the nShield Connect XC appliance with model number NH2075-x or NH2089-x (where x is B, M or H)	PCIe board embedded in nShield Connect XC appliance.	Courier
Firmware	Solo XC firmware image	v12.60.15	.nff binary image file in ISO image or DVD	Courier or Web download
Documentation	nShield Solo XC Common Criteria Evaluated Configuration Guide	v1.1.1	pdf file	Web download

Note: the variants nC3025E-000 and nC4035E-000 are equivalent. The variant nC4335N-000 doesn't mount a fan and the front bezel.

The logical boundary of the TOE comprises the firmware located inside the PCIe board, except CodeSafe embedded applications.

Due to the nature of the TOE, it only provides local interfaces to local applications, as defined in [CEN EN 419221-5].

The TOE defined in this Security Target can be deployed in two configurations, as follows.

Configuration 1: Solo XC embedded in Connect XC

In this configuration, the TOE is located inside an nShield Connect XC network appliance. The Hardserver, which runs on the Connect XC main motherboard, is a local application for the TOE. The Hardserver instance in the Connect XC establishes a secure channel (Impath, out of scope) with a remote Hardserver (typically on an application server or PC), which also includes libraries to support higher level APIs, for example, but not limited to NFKM, PKCS#11, MSCAPI, etc. These are out of scope of the TOE.

Figure 3 Configuration 1: TOE in Connect XC

Configuration 2: Standalone Solo XC in host PC/Server

In this configuration, the TOE is located inside a server or general purpose PC appliance. The Hardserver, which runs on a host PC/Server, is a local application for the TOE. Running in the host PC/Server are also libraries to support higher level APIs, for example, but not limited to, NFKM, PKCS#11, MSCAPI, etc. These are out of scope of the TOE.

Figure 4 Configuration 2: TOE in host server

1.3.3 Usage and major security features of the TOE

The TOE provides the following major security features:

- Cryptographic functions, including digital signature, encryption/decryption, key agreement, message digest, message authentication, key generation
- Random Number Generation compliant with [AIS 31] and NIST [SP 800-90A]
- Secure key management

- Secure logging
- Physical tamper resistance meeting [ISO 19790] Level 3

The TOE can be used as a general purpose Cryptographic Module in a wide range of use cases, including, but not limited to Trust Service Providers, for example with [CEN EN 419241-2]. to provide a qSCD for Remote Server Signing.

1.3.4 Non-TOE hardware/software/firmware required by the TOE

The following hardware and software, which has not been evaluated, is required by the TOE:

- nShield Connect XC network appliance or host PC/Server, depending on the configuration
- Host side software, including drivers, Hardserver, and high level APIs, which are provided by nCipher Security
- Set of smartcards, TV and module warrant certificate, provided by nCipher Security, for card based authorisation
- Syslog server for long-term storage of audit logs

2 Conformance Claim

2.1 CC conformance claim

This Security Target is conformant to Common Criteria version 3.1 revision 5.

More precisely, this Security Target is:

- CC Part 2 extended [CC2]
- CC Part 3 conformant [CC3]

The assurance requirement of this Protection Profile is EAL4 augmented by:

- AVA_VAN.5 Advanced methodical vulnerability analysis
- ALC_FLR.2 Flaw reporting procedures

2.2 PP claim

This Security Target claims strict conformance to Protection profiles for TSP Cryptographic modules - Part 5 Cryptographic Module for Trust Services version 1.0, [CEN EN 419221-5].

2.3 Conformance claim rationale

The Security Target includes all the Threats, OSPs, Assumptions and Objectives in the Protection Profile.

The following SFRs, which are marked as optional in the Protection Profile, have been removed in this Security Target:

- FTP_TRP.1/External

3 Security Problem Definition

3.1 Assets

The assets that need to be protected by the TOE are identified below.

R.SecretKey: secret keys used in symmetric cryptographic functions and private keys used in asymmetric cryptographic functions, managed and used by the TOE in support of the cryptographic services that it offers. This includes user keys, owned and used by specific users, and support keys used in the implementation and operation of the TOE. The asset also includes copies of such keys made for external storage and/or backup purposes. The confidentiality and integrity of these keys must be protected.

R.PubKey: public keys managed and used by the TOE in support of the cryptographic services that it offers (including user keys and support keys). This asset includes copies of keys made for external storage and/or backup purposes. The integrity of these keys must be protected.

R.ClientData: data supplied by a client for use in a cryptographic function. Depending on the context, this data may require confidentiality and/or integrity protection.

R.RAD: reference data held by the TOE that is used to authenticate an administrator (hence to control access to privileged administrator functions such as TOE backup, export of audit data) or to authorise a user for access to secret and private keys (R.SecretKey). This asset includes copies of authentication/authorisation data made for external storage and/or backup purposes. The integrity of the RAD must be protected; its confidentiality must also be protected unless the authentication method used means that the RAD is public data (such as a public key).

3.2 Subjects

The types of subjects identified in this ST are:

S.Application: a client application, or process acting on behalf of a client application and that communicates with the TOE over a local or external interface. Client applications will in some situations be acting directly on behalf of end users (see S.User).

S.User: an end user of the TOE who can be associated with secret keys and authentication/authorisation data held by the TOE. An end user communicates with the TOE by using a client application (S.Application).

S.Admin: an administrator of the TOE. Administrators are responsible for performing the TOE initialisation, TOE configuration and other TOE administrative functions.

3.3 Threats

The following threats are defined for the TOE.

T.KeyDisclose Unauthorised disclosure of secret/private key

An attacker obtains unauthorised access to the plaintext form of a secret key (R.SecretKey), enabling either direct reading of the key or other copying into a form that can be used by the attacker as though the key were their own. This access may be gained during generation, storage, import/export, use of the key, or backup if supported by the TOE.

T.KeyDerive Derivation of secret/private key

An attacker derives a secret key (R.SecretKey) from publicly known data, such as the corresponding public key or results of cryptographic functions using the key or any other data that is generally available outside the TOE.

T.KeyMod Unauthorised modification of a key

An attacker makes an unauthorised modification to a secret or public key (R.SecretKey or R.PubKey) while it is stored in, or under the control of, the TOE, including export and backups ~~if supported~~. This includes replacement of a key as well as making changes to the value of a key, or changing its attributes such as required authorisation, usage constraints or identifier (changing the identifier to the identifier used for another key would allow unauthorised substitution of the original key with a key known to the attacker). The threat therefore includes the case where an attacker is able to break the binding between a key and its critical attributes.

T.KeyMisuse Misuse of a key

An attacker uses the TOE to make unauthorised use of a secret key (R.SecretKey) that is managed by the TOE (including the unauthorised use of a secret key for a cryptographic function that is not permitted for that key), without necessarily obtaining access to the value of the key.

T.KeyOveruse Overuse of a key

An attacker uses a key (R.SecretKey) that has been authorised for a specific use (e.g. to make a single signature) in other cryptographic functions that have not been authorised.

T.DataDisclose Disclosure of sensitive client application data

An attacker gains access to data that requires protection of confidentiality (R.ClientData, and possibly R.RAD) supplied by a client application during transmission to or from the TOE ~~or during transmission between physically separate parts of the TOE~~.

T.DataMod Unauthorised modification of client application data

An attacker modifies data (R.ClientData such as DTBS/R, authentication/authorisation data, or a public key (R.PubKey)) supplied by a client application during transmission to the TOE ~~or during transmission between physically separate parts of the TOE~~, so that the result returned by the TOE (such as a signature or public key certificate) does not match the data intended by the originator of the request.

T.Malfunction Malfunction of TOE hardware or software

The TOE may develop a fault that causes some other security property to be weakened or to fail. This may affect any of the assets and could result in any of the other threats being realised. Particular causes of faults to be considered are:

- Environmental conditions (including temperature and power)
- Failures of critical TOE hardware components (including the RNG)
- Corruption of TOE software.

3.4 Organisation Security Policies

P.Algorithms Use of approved cryptographic algorithms

The TOE offers key generation functions and other cryptographic functions provided for users that are endorsed by recognised authorities as appropriate for use by TSPs.

P.KeyControl Support for control of keys

The life cycle of the TOE and any secret keys that it manages (where such keys are associated with specific entities, such as the signature creation data associated with a signatory or the seal creation data

associated with a seal creator), shall be implemented in such a way that the secret keys can be reliably protected by the legitimate owner against use by others, and in such a way that the use of the secret keys by the TOE can be confined to a set of authorised cryptographic functions.

P.RNG Random Number Generation

The TOE is required to generate random numbers that meet PTG.2 and DRG.4, as defined in AIS 31 and NIST SP 800-90A ~~a specified quality metric~~, for use by client applications. These random numbers shall be suitable for use as keys, authentication/authorisation data, or seed data for another random number generator that is used for these purposes.

P.Audit Audit trail generation

The TOE is required to generate an audit trail of security-relevant events, recording the event details and the subject associated with the event.

Application note: The TOE is assumed to be part of a larger system that manages audit data. The TOE therefore logs audit records, and it is assumed that these are collected, maintained and reviewed in the larger system. Hence there is no separate auditor role within the cryptographic module TOE, but the role of System Auditor is assumed to exist in the larger system – cf. A.AuditSupport.

3.5 Assumptions

A.ExternalData Protection of data outside TOE control

Where copies of data protected by the TOE are managed outside of the TOE, client applications and other entities must provide appropriate protection for that data to a level required by the application context and the risks in the deployment environment.

In particular, any backups of the TOE and its data are maintained in a way that ensures appropriate controls over making backups, storing backup data, and using backup data to restore an operational TOE. The number of sets of backup data does not exceed the minimum needed to ensure continuity of the TSP service. The ability to restore a TOE to an operational state from backup data requires at least dual person control (i.e. the participation and approval of more than one authenticated administrator).

A.Env Protected operating environment

The TOE operates in a protected environment that limits physical access to the TOE to authorised Administrators. The TOE software and hardware environment (including client applications) is installed maintained by Administrators in a secure state that mitigates against the specific risks applicable to the deployment environment.

A.DataContext Appropriate use of TOE functions

Any client application using the cryptographic functions of the TOE will ensure that the correct data are supplied in a secure manner (including any relevant requirements for authenticity, integrity and confidentiality). For example, when creating a digital signature over a DTBS the client application will ensure that the correct (authentic, unmodified) DTBS/R is supplied to the TOE, and will correctly and securely manage the signature received from the TOE; and when certifying a public key the client application will ensure that necessary checks are made to prove possession of the corresponding private key. The client application may make use of appropriate secure channels provided by the TOE to support these security requirements. Where required by the risks in the operational environment a suitable entity (possibly the client application) performs a check of the signature returned from the TOE, to confirm that it relates to the correct DTBS.

Client applications are also responsible for any required logging of the uses made of the TOE services, such as signing (or sealing) events.

Similar requirements apply in local use cases where no client application need be involved, but in which the TOE and its user data (such as keys used for signatures) need to be configured in ways that will support the need for security requirements such as sole control of signing keys.

Appropriate procedures are defined for the initial creation of data and continuing operation of the TOE according to the specific risks applicable to the deployment environment and the ways in which the TOE is used.

A.UAuth Authentication of application users

Any client application using the cryptographic services of the TOE will correctly and securely gather identification and authentication/authorisation data from its users and securely transfer it to the TOE (protecting the confidentiality of the authentication/authorisation data as required) when required to authorise the use of TOE assets and services.

A.AuditSupport Audit data review

The audit trail generated by the TOE will be collected, maintained and reviewed by a System Auditor according to a defined audit procedure for the TSP.

A.AppSupport Application security support

Procedures to ensure the ongoing security of client applications and their data will be defined and followed in the environment, and reflected in use of the appropriate TOE cryptographic functions and parameters, and appropriate management and administration actions on the TOE. This includes, for example, any relevant policies on algorithms, key generation methods, key lengths, key access, key import/export, key usage limitations, key activation, cryptoperiods and key renewal, and key/certificate revocation.

4 Security Objectives

This section identifies and defines the security objectives for the TOE and its operational environment.

Security objectives reflect the stated intent and counter the identified threats, as well as comply with the identified organisational security policies and assumptions.

4.1 Security Objectives for the TOE

The following security objectives describe security functions to be provided by the TOE.

OT.PlainKeyConf Protection of confidentiality of plaintext secret keys

The plaintext value of secret keys is not made available outside the TOE (except where the key has been exported securely in the manner of OT.ImportExport). This includes protection of the keys during generation, storage (including external storage), and use in cryptographic functions, and means that even authorised users of the keys and administrators of the TOE cannot directly access the plaintext value of a secret key.

OT.Algorithms Use of approved cryptographic algorithms

The TOE offers key generation functions and other cryptographic functions provided for users that are endorsed by recognised authorities as appropriate for use by TSPs. This ensures that the algorithms used do not enable publicly known data to be used to derive secret keys.

OT.KeyIntegrity Protection of integrity of keys

The value and critical attributes of keys (secret or public) have their integrity protected by the TOE against unauthorised modification (unauthorised modifications include making unauthorised copies of a key such that the attributes of the copy can be changed without the same authorisation as for the original key). Critical attributes in this context are defined to be those implementation-level attributes of a key that could be used by an attacker to cause the equivalent of a modification to the key value by other means (e.g. including changing the cryptographic functions for which a key can be used, the users with access to the key, or the identifier of the key). This objective includes protection of the keys during generation, storage (including external storage), and use.

OT.Auth Authorisation for use of TOE functions and data

The TOE carries out an authentication/authorisation check on all subjects before allowing them to use the TOE. The following types of entity are distinguished for the purposes of authorisation (i.e. each type has a distinct method of authorisation):

- administrators of the TOE
- ~~users of TOE cryptographic functions (client applications using secure channels)~~
- users of secret keys

In particular, the TOE always requires authorisation before using a secret key.

Application Note: Local client applications within a suitable security environment (such as client applications that are connected to the TOE by a channel such as a PCIe bus within the same hardware appliance) do not require authentication to communicate with the TOE, as noted in section 1.3.1 of the PP. However, use of a secret key always requires prior authorisation.

OT.KeyUseConstraint Constraints on use of keys

Any key (secret or public) has an unambiguous definition of the purposes for which it can be used, in terms of the cryptographic functions or operations (e.g. encryption or signature) that it is permitted to be used for. The TOE rejects any attempt to use the key for a purpose that is not permitted. The TOE also has an unambiguous definition of the subjects that are permitted to access the key (and the purposes for which this access can be used) and allows this to be set to the granularity of an individual subject – these access constraints apply to use of the key even where the key value is not accessible. This objective means that the TOE also prevents unauthorised use of any cryptographic functions that use a key.

OT.KeyUseScope Defined scope for use of a key after authorisation

The TOE is required to define and apply clearly stated limits on when authorisation and reauthorisation are required in order for a secret key to be used. For example the TOE may allow secret keys to be used for a specified time period or number of uses after initial authorisation, or for may allow the key to be used until authorisation is explicitly rescinded. As another example, the TOE may implement a policy that requires re-authorisation before every use of a secret key.

Application Note: Such limits on the use of a key after initial authorisation are termed “re-authorisation conditions” in this PP. A wide range of policies and re-authorisation conditions are allowed, and different policies may be applied to different types of secret key, but the re-authorisation conditions for all types of secret key must be unambiguously defined in the Security Target. The decision to use supported reauthentication conditions is made on the basis of the application context. Making appropriate use of re-authorisation conditions supports client applications in meeting their requirements for OE.DataContext and OE.AppSupport.

OT.DataConf Protection of confidentiality of sensitive client application data

The TOE provides secure channels to client applications that can be used to protect the confidentiality of sensitive data (such as authentication/authorisation data) during transmission between the client application and the TOE, ~~or during transmission between separate parts of the TOE where that transmission passes through an insecure environment.~~

Application Note: Protection of secret keys (as a specific type of sensitive data) is also subject to additional protection specified in other TOE objectives. Any requirements for secure storage and control of access to other types of client application data within the TOE rely on the client application using appropriate interfaces and cryptographic functions to protect it, as required by OE.DataContext and OE.AppSupport. For example, if a client application uses the TOE to perform cryptographic functions on data that represent a passphrase value and the passphrase value is to be stored on the TOE, then the client application would need to use an appropriate encryption function before storing the data on the TOE.

OT.DataMod Protection of integrity of client application data

The TOE provides secure channels to client applications that can be used to protect the integrity of sensitive data (such as data to be signed, authentication/authorisation data or public key certificates) during transmission between the client application and the TOE.

OT.ImportExport Secure import and export of keys

The TOE allows import and export of secret keys only by using a secure method that protects the confidentiality and integrity of the data during transmission – in particular, secret keys must be exported only in encrypted form (it is not sufficient to rely on properties of a secure channel to provide the protection: the key itself must be encrypted). The TOE also allows individual secret keys under its control to be identified as non-exportable, in which case any attempt to export them will be rejected automatically. Public keys may be imported and exported in a manner that protects the integrity of the data during transmission.

Assigned keys cannot be imported or exported.

OT.Backup Secure backup of user data

Any method provided by the TOE for backing up user data, including secret keys, preserves the security of the data and is controlled by authorised Administrators. The secure backup process preserves the confidentiality and integrity of the data during creation, transmission, storage and restoration of the backup data. Backups also preserve the integrity of the attributes of keys.

OT.RNG Random number quality

Random numbers generated and provided to client applications for use as keys, authentication/authorisation data, or seed data for another random number generator that is used for these purposes shall meet PTG.2 and DRG.4, as defined in AIS 31 and NIST SP 800-90A ~~a defined quality metric~~ in order to ensure that random numbers are not predictable and have sufficient entropy.

OT.TamperDetect Tamper Detection

The TOE shall provide features to protect its security functions against tampering. In particular the TOE shall make any physical manipulation within the scope of the intended environment (adhering to OE.Env) detectable for the administrators of the TOE.

OT.FailureDetect Detection of TOE hardware or software failures

The TOE detects faults that would cause some other security property to be weakened or to fail, including:

- Environmental conditions outside normal operating range (including temperature and power)
- Failures of critical TOE hardware components (including the RNG)
- Corruption of TOE software

On detection of a fault, the TOE takes action to maintain its security and the security of the data that it contains and controls.

OT.Audit Generation of audit trail

The TOE creates audit records for security-relevant events, recording the event details and the subject associated with the event. The TOE ensures that the audit records are protected against accidental or malicious deletion or modification of records by providing tamper protection (~~either prevention or detection~~) for the audit log.

4.2 Security Objectives for the Operational Environment

The following security objectives relate to the TOE environment. This includes client applications as well as the procedure for the secure operation of the TOE.

OE.ExternalData Protection of data outside TOE control

Where copies of data protected by the TOE are managed outside of the TOE, client applications and other entities shall provide appropriate protection for that data to a level required by the application context and the risks in the deployment environment. This includes protection of data that is exported from, or imported to, the TOE (such as audit data and encrypted keys).

In particular, any backups of the TOE and its data shall be maintained in a way that ensures appropriate controls over making backups, storing backup data, and using backup data to restore an operational TOE. The number of sets of backup data shall not exceed the minimum needed to ensure continuity of the TSP service. The ability to restore a TOE to an operational state from backup data shall require at least dual person control (i.e. the participation and approval of more than one authenticated administrator).

OE.Env Protected operating environment

The TOE shall operate in a protected environment that limits physical access to the TOE to authorised Administrators. The TOE software and hardware environment (including client applications) shall be

installed and maintained by Administrators in a secure state that mitigates against the specific risks applicable to the deployment environment, including (where applicable):

- Protection against loss or theft of the TOE or any of its externally stored assets
- Inspections to deter and detect tampering (including attempts to access side-channels, or to access connections between physically separate parts of the TOE, or parts of the hardware appliance)
- Protection against the possibility of attacks based on emanations from the TOE (e.g. electromagnetic emanations) according to risks assessed for the operating environment
- Protection against unauthorised software and configuration changes on the TOE and the hardware appliance
- Protection to an equivalent level of all instances of the TOE holding the same assets (e.g. where a key is present as a backup in more than one instance of the TOE)

OE.DataContext Appropriate use of TOE functions

Any client application using the cryptographic functions of the TOE shall ensure that the correct data are supplied in a secure manner (including any relevant requirements for authenticity, integrity and confidentiality). For example, when creating a digital signature over a DTBS the client application shall ensure that the correct (authentic, unmodified) DTBS/R is supplied to the TOE, and shall correctly and securely manage the signature received from the TOE; and when certifying a public key the client application shall ensure that necessary checks are made to prove possession of the corresponding private key. The client application may make use of appropriate secure channels provided by the TOE to support these security requirements. Where required by the risks in the operational environment a suitable entity (possibly the client application) shall perform a check of the signature returned from the TOE, to confirm that it relates to the correct DTBS.

Client applications shall be responsible for any required logging of the uses made of the TOE services, such as signing (or sealing) events.

Similar requirements shall apply in local use cases where no client application need be involved, but in which the TOE and its user data (such as keys used for signatures) need to be configured in ways that will support the need for security requirements such as sole control of signing keys.

Appropriate procedures shall be defined for the initial creation of data and continuing operation of the TOE according to the specific risks applicable to the deployment environment and the ways in which the TOE is used.

OE.Uauth Authentication of application users

Any client application using the cryptographic services of the TOE shall correctly and securely gather identification and authentication/authorisation data from its users and securely transfer it to the TOE (protecting the confidentiality of the authentication/authorisation data as required) when required to authorise the use of TOE assets and services.

OE.AuditSupport Audit data review

The audit trail generated by the TOE will be collected, maintained and reviewed by a System Auditor according to a defined audit procedure for the TSP.

Application Note: As noted for P.Audit, the TOE is assumed to exist as part of a larger system and the System Auditor is a role within this larger system.

OE.AppSupport Application security support

Procedures to ensure the ongoing security of client applications and their data shall be defined and followed in the environment, and reflected in use of the appropriate TOE cryptographic functions and parameters, and appropriate management and administration actions on the TOE. This includes, for

example, any relevant policies on algorithms, key generation methods, key lengths, key access, key import/export, key usage limitations, key activation, cryptoperiods and key renewal, and key/certificate revocation.

5 Extended Components Definition

Refer to the extended components defined in the Extended Components Definition section of [CEN EN 419221-5]. This ST doesn't define additional components than those already defined in the Protection Profile.

6 Security Requirements

6.1 Typographical Conventions

The following conventions are used in the definitions of the SFRs:

- Selections and assignments made in this ST are ***italicised and bold***
- Text from the Protection Profile [CEN EN 419221-5] which is not applicable to this ST is ~~crossed-out~~

6.2 Security Functional Requirements

6.2.1 Cryptographic Support (FCS)

FCS_CKM.1 Cryptographic key generation

Hierarchical to:	No other components
Dependencies:	FCS_COP.1 Cryptographic operation FCS_CKM.4 Cryptographic key destruction
FCS_CKM.1.1	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm <i>list of key generation algorithm specified in Key Generation Table below</i> and specified cryptographic key sizes <i>specified in Key Generation Table below</i> that meet the following: <i>list of standards specified in Key Generation Table below.</i>

Key generation algorithm	Key size(s)	Standard
Asymmetric key generation	See FCS_COP.1	FIPS 186-4 SP 800-56A
Symmetric key generation	See FCS_COP.1	Direct generation using FCS_RNG.1/DRBG

Table 1 Key Generation Table

FCS_CKM.4 Cryptographic key destruction

Hierarchical to:	No other components
Dependencies:	FCS_CKM.1 Cryptographic key generation
FCS_CKM.4.1	The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method <i>zeroisation</i> that meets the following: <i>FIPS 140-2 Level 3.</i>

FCS_COP.1 Cryptographic operation

Hierarchical to:	No other components
Dependencies:	FCS_CKM.1 Cryptographic key generation FCS_CKM.4 Cryptographic key destruction
FCS_COP.1.1	The TSF shall perform <i>list of cryptographic operations specified in Cryptographic Algorithms Table below</i> in accordance with a specified cryptographic algorithm <i>specified in Cryptographic</i>

[Algorithms Table below](#) and cryptographic key sizes *specified in [Cryptographic Algorithms Table below](#)* that meet the following: *list of standards specified in [Cryptographic Algorithms Table below](#)*.

Cryptographic operation	Cryptographic algorithm	Key size(s)	Standard
Digital signature generation and verification	RSA PKCS#1 v.1.5	1024 (verification only), 2048, 3072 and 4096 bits	FIPS 186-4
	RSA PKCS#1 PSS	1024, 2048, 3072 and 4096 bits	FIPS 186-4
	Digital Signature Algorithm (DSA)	L = 1024 bits, N = 160 bits (verification only) L = 2048 bits, N = 224 bits L = 2048 bits, N = 256 bits L = 3072 bits, N = 256 bits	FIPS 186-4
	Elliptic Curve Digital Signature Algorithm (ECDSA)	Supported NIST curves: NIST P-192 (verification only), P-224, P-256, P-384, P-521 NIST K-163 (verification only), K-233, K-283, K-409, K-571 NIST B-163 (verification only), B-233, B-283, B-409, B-571 Supported Brainpool curves: brainpoolP160r1 (verification only), brainpoolP192r1 (verification only), brainpoolP224r1, brainpoolP256r1, brainpoolP320r1, brainpoolP384r1, brainpoolP512r1 brainpoolP160t1 (verification only), brainpoolP192t1 (verification only), brainpoolP224t1, brainpoolP256t1, brainpoolP320t1, brainpoolP384t1, brainpoolP512t1	FIPS 186-4
Encryption and decryption	AES Supported modes: ECB, CBC, GCM	128, 192, 256 bits	FIPS 197 SP 800-38A SP 800-38C SP 800-38D
	Triple-DES Supported modes: ECB, CBC	112 (decryption only), 168 bits	SP 800-67 SP 800-38A
	RSA Supported modes: OAEP, PKCS#1 v1.5	2048, 3072 and 4096 bits	PKCS#1
Message digest	SHA-1, SHA-224, SHA-256, SHA-384, SHA-512	n/a	FIPS 180-4

Message authentication	AES CMAC	128, 192, 256 bits	SP 800-38B
	Triple-DES CBC-MAC	112 (verification only), 168 bits	SP 800-38B SP 800-38D
	HMAC	key size < block size, key size = block size and key size > block size	FIPS 198-1
Key establishment	Diffie-Hellman (DH)	$p \geq 2048$ bits and $q \geq 224$ bits	SP 800-56A
	Elliptic Curve Diffie-Hellman (ECDH)	Supported NIST curves: NIST P-224, P-256, P-384, P-521 NIST K-233, K-283, K-409, K-571 NIST B-233, B-283, B-409, B-571 Supported Brainpool curves: brainpoolP224r1, brainpoolP256r1, brainpoolP320r1, brainpoolP384r1, brainpoolP512r1 brainpoolP224t1, brainpoolP256t1, brainpoolP320t1, brainpoolP384t1, brainpoolP512t1	SP 800-56A
	Elliptic Curve Menezes–Qu–Vanstone (ECMQV)	Supported NIST curves: NIST P-224, P-256, P-384, P-521 NIST K-233, K-283, K-409, K-571 NIST B-233, B-283, B-409, B-571 Supported Brainpool curves: brainpoolP224r1, brainpoolP256r1, brainpoolP320r1, brainpoolP384r1, brainpoolP512r1 brainpoolP224t1, brainpoolP256t1, brainpoolP320t1, brainpoolP384t1, brainpoolP512t1	SP 800-56A
	AES Key Wrapping and AES Key Wrapping with Padding	128, 192, 256 bits	SP 800-38F
	Concatenation KDF	n/a	SP 800-56A
	AES KDF in counter mode	128, 192, 256 bits	SP 800-108

Table 2 Cryptographic Algorithms Table

FCS_RNG.1/PTRNG Generation of random numbers (AIS 31 class PTG.2)

Hierarchical to:	No other components
Dependencies:	No dependencies.
FCS_RNG.1.1/PTRNG	The TSF shall provide a physical random number generator that implements: (PTG.2.1) A total failure test detects a total failure of entropy source immediately when the

	<p>RNG has started. When a total failure is detected, no random numbers will be output.</p> <p>(PTG.2.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source.</p> <p>(PTG.2.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected.</p> <p>(PTG.2.4) The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.</p> <p>(PTG.2.5) The online test procedure checks the quality of the raw random number sequence. It is triggered continuously. The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time.</p>
FCS_RNG.1.2/PTRNG	<p>The TSF shall provide octets of bits that meet:</p> <p>(PTG.2.6) Test procedure A and none does not distinguish the internal random numbers from output sequences of an ideal RNG.</p> <p>(PTG.2.7) The average Shannon entropy per internal random bit exceeds 0.997</p>

Note: The Physical True RNG is only used to seed the Deterministic RNG defined in FCS_RNG.1/DRBG.

FCS_RNG.1/DRBG Generation of random numbers (AIS 20 class DRG.4)

Hierarchical to:	No other components
Dependencies:	No dependencies.
FCS_RNG.1.1/DRBG	<p>The TSF shall provide a hybrid deterministic random number generator that implements:</p> <p>(DRG.4.1) The internal state of the RNG shall have at least 128 bits of entropy.</p> <p>(DRG.4.2) The RNG provides forward secrecy.</p> <p>(DRG.4.3) The RNG provides backward secrecy even if the current internal state is known.</p> <p>(DRG.4.4) The RNG provides enhanced forward secrecy on condition reseeding (every 1.4e6 requests).</p> <p>(DRG.4.5) The internal state of the RNG is seeded by an PTRNG of class PTG.2.</p>
FCS_RNG.1.2/DRBG	<p>The TSF shall provide octets of bits that meet:</p> <p>(DRG.4.6) The RNG generates output for which 2⁴⁷ strings of bit length 128 are mutually different with probability 1 - 2⁻³⁴</p> <p>(DRG.4.7) Statistical test suites cannot practically distinguish the random numbers from output sequences of an ideal RNG. The random numbers must pass test procedure A and NIST SP 800-22 test suite.</p>

Note: The second assignment in DRG.4.6 is derived from the maximum requests per reseed defined in [SP 800-90A] for an output block size of 256 bits. The probability is derived from the formula in [AIS31, para. 337]. This corresponds to AVA_VAN.5 as specified in [AIS31, Table 13] with $k > 2^{34}$ $\epsilon < 2^{-16}$.

6.2.2 Identification and Authentication (FIA)

FIA_UID.1 Timing of identification

Hierarchical to:	No other components.
------------------	----------------------

Dependencies:	No dependencies.
FIA_UID.1.1	The TSF shall allow (1) Self test according to FPT_TST_EXT.1 (2) unauthenticated commands (see note in FIA_UAU.1) on behalf of the user to be performed before the user is identified.
FIA_UID.1.2	The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

FIA_UAU.1 Timing of authentication

Hierarchical to:	No other components.
Dependencies:	FIA_UID.1 Timing of identification.
FIA_UAU.1.1	The TSF shall allow (1) Self-test according to FPT_TST_EXT.1, (2) Identification of the user by means of TSF required by FIA_UID.1 (3) unauthenticated commands (see note below) on behalf of the user to be performed before the user is authenticated.
FIA_UAU.1.2	The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

Note: FIA_UID.1 and FIA_UAU.1 are applicable for Administration authentication. The following list of commands don't require Administrator authentication:

Big number operations, Create and load buffer, Crypto operations (sign, verify, encrypt, decrypt), Duplicate key handle, Enable feature, Check user action, Clear Unit, Write to smartcards, File operations, Firmware authenticate, Force module to fail, Firmware update, Generate random, Generate prime, Get ACL, Set ACL, Get App data / Get App data, Get challenge, Get KLF, Get Key Info, Get KML, Get slot list, Get Logical Token info, Get KM list, Get module state, Get RTC, Get Share ACL, Get slot info, Get Ticket, Redeem Ticket, Initialise unit, Insert token, Remove token, Public key import and export, Generate Logical Token, Hash, Modular exponentiation, Get module info, Read Share, Destroy handle, Get statistics, Get status, SEE world operations, Get signed module state, Initialise Unit.

FIA_UAU.6/KeyAuth_Token Re-authenticating

Hierarchical to:	No other components
Dependencies:	No dependencies.
FIA_UAU.6.1/KeyAuth_Token	The TSF shall authorise and re-authorise the user for access to a secret key under the conditions (1) Authorisation in order to be granted initial access to the key; and (2) Re-authorisation of token protected secret keys under the following conditions: <ul style="list-style-type: none"> • after expiry of the time period (as specified in the secret key's attributes) for which the secret key was last authorised; • after the number of uses of the secret key (as specified in the secret key's attributes) for which the secret key was last authorised has already been made; • after explicit rescinding of previous authorisation for access to the secret key.

FIA_AFL.1 Authentication failure handling

Hierarchical to:	No other components.
Dependencies:	FIA_UAU.1 Timing of authentication.
FIA_AFL.1.1	The TSF shall detect when one unsuccessful authentication or authorisation attempts occur related to consecutive failed authentication or authorisation attempts
FIA_AFL.1.2	When the defined number of unsuccessful authentication or authorisation attempts has been met , the TSF shall block access to command processing until a time period of 4s has elapsed.

FIA_UAU.6/KeyAuth_CertifierKey Re-authenticating

Hierarchical to:	No other components
Dependencies:	No dependencies.
FIA_UAU.6.1/KeyAuth_CertifierKey	The TSF shall authorise and re-authorise the user for access to a secret key under the conditions (1) Authorisation in order to be granted initial access to the key; and (2) Re-authorisation of certifier key protected secret keys under the following conditions: <ul style="list-style-type: none">• after explicit rescinding of previous authorisation for access to the secret key.

6.2.3 User data protection (FDP)

FDP_IFC.1/KeyBasics Subset information flow control

Hierarchical to:	No other components
Dependencies:	FDP_IFF.1 Simple security attributes
FDP_IFC.1.1/KeyBasics	The TSF shall enforce the Key Basics SFP on (1) subjects: all; (2) information: keys; (3) operations: all.

FDP_IFF.1/KeyBasics Simple security attributes

Hierarchical to:	No other components
Dependencies:	FDP_IFC.1 Subset information flow control FMT_MSA.3 Static attribute initialisation
FDP_IFF.1.1/KeyBasics	The TSF shall enforce the Key Basics SFP based on the following types of subject and information security attributes: (1) whether a key is a secret or a public key (2) whether a secret key is an Assigned Key (3) whether channels selected to export keys are secure (4) the value of the Export Flag of a key.
FDP_IFF.1.2/KeyBasics	The TSF shall permit an information flow between a controlled subject and controlled

	<p>information via a controlled operation if the following rules hold:</p> <p>(1) Export of secret keys shall only be allowed provided that the secret key is not an Assigned Key, that the secret key is encrypted, and that a secure channel (providing authentication and integrity protection) is used for the export;</p> <p>(2) Public keys shall always be exported with integrity protection of their key value and attributes;</p> <p>(3) Keys shall only be imported over a secure channel (providing authentication and integrity protection);</p> <p>(4) A secret key can only be imported if it is a non-Assigned key;</p> <p>(5) Secret keys shall only be imported in encrypted form or using split-knowledge procedures requiring at least two key components to reconstruct the key, with key components supplied by at least two separately authenticated users.</p>
FDP_IFF.1.3/KeyBasics	The TSF shall enforce the following additional information flow control rules: none.
FDP_IFF.1.4/KeyBasics	The TSF shall explicitly authorise an information flow based on the following rules: none.
FDP_IFF.1.5/KeyBasics	<p>The TSF shall explicitly deny an information flow based on the following rules:</p> <p>(1) No subject shall be allowed to access the plaintext value of any secret key directly;</p> <p>(2) No subject shall be allowed to export a secret key in plaintext;</p> <p>(3) No subject shall be allowed to export an Assigned Key;</p> <p>(4) No subject shall be allowed to export a secret key without submitting the correct authorisation data for the key;</p> <p>(5) No subject shall be allowed to access intermediate values in any operation that uses a secret key;</p> <p>(6) A key with an Export Flag value marking it as non-exportable shall not be exported.</p>

Note: The requirement "(6) Unblocking access to a key shall not allow any subject other than those authorised to access the key at the time when it was blocked." in FDP_IFF.1.2/KeyBasics in the PP is not applicable (refer FMT_MTD.1/Unblock) and, for readability purposes, has been removed in the ST.

FDP_ACC.1/KeyUsage Subset access control

Hierarchical to:	No other components
Dependencies:	FDP_ACF.1 Security attribute based access control
FDP_ACC.1.1/KeyUsage	<p>The TSF shall enforce the Key Usage SFP on</p> <p>(1) subjects: all;</p> <p>(2) objects: keys;</p> <p>(3) operations: all.</p>

FDP_ACF.1/KeyUsage Security attribute based access control

Hierarchical to:	No other components
Dependencies:	<p>FDP_ACC.1 Subset access control</p> <p>FMT_MSA.3 Static attribute initialisation</p>
FDP_ACF.1.1/KeyUsage	The TSF shall enforce the Key Usage SFP to objects based on the following:

	<p>(1) whether the subject is currently authorised to use the secret key;</p> <p>(2) whether the subject is currently authorised to change the attributes of the secret key;</p> <p>(3) the cryptographic function that is attempting to use the secret key.</p>
FDP_ACF.1.2/KeyUsage	<p>The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:</p> <p>(1) Attributes of a key shall only be changed by an authorised subject, and only as permitted in the Key Attributes Modification Table</p> <p>(2) Only subjects with current authorisation for a specific secret key shall be allowed to carry out operations using the plaintext value of that key</p> <p>(3) Only cryptographic functions permitted by the secret key's Key Usage attribute shall be carried out using the secret key.</p>
FDP_ACF.1.3/KeyUsage	<p>The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: none.</p>
FDP_ACF.1.4/KeyUsage	<p>The TSF shall explicitly deny access of subjects to objects based on the following additional rules: none.</p>

FDP_ACC.1/Backup Subset access control

Hierarchical to:	No other components
Dependencies:	FDP_ACF.1 Security attribute based access control
FDP_ACC.1.1/Backup	<p>The TSF shall enforce the Backup SFP on</p> <p>(1) subjects: all;</p> <p>(2) objects: keys;</p> <p>(3) operations: backup, restore.</p>

FDP_ACF.1/Backup Security attribute based access control

Hierarchical to:	No other components
Dependencies:	<p>FDP_ACC.1 Subset access control</p> <p>FMT_MSA.3 Static attribute initialisation</p>
FDP_ACF.1.1/Backup	<p>The TSF shall enforce the Backup SFP to objects based on the following:</p> <p>(1) whether the subject is an administrator</p>
FDP_ACF.1.2/Backup	<p>The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:</p> <p>(1) Only authorised administrators shall be able to perform any backup operation provided by the TSF to create backups of the TSF state or to restore the TSF state from a backup</p> <p>(2) Any restore of the TSF shall only be possible under at least dual person control, with each person being an administrator</p> <p>(3) Any backup and restore shall preserve the confidentiality and integrity of the secret keys, and the integrity of public keys</p> <p>(4) Any backup and restore operations shall preserve the integrity of the key attributes, and the binding of each set of attributes to its key.</p>
FDP_ACF.1.3/Backup	<p>The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: none.</p>

FDP_ACF.1.4/Backup	The TSF shall explicitly deny access of subjects to objects based on the following additional rules: none.
--------------------	--

FDP_SDI.2 Stored data integrity monitoring and action

Hierarchical to:	FDP_SDI.1 Stored data integrity monitoring.
Dependencies:	No dependencies.
FDP_SDI.2.1	The TSF shall monitor user data stored in containers controlled by the TSF for integrity errors on all keys (including security attributes), based on the following attributes: integrity protection data.
FDP_SDI.2.2	Upon detection of a data integrity error, the TSF shall <ul style="list-style-type: none"> (1) prohibit the use of the altered data; (2) notify the error to the user.

FDP_RIP.1 Subset residual information protection

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FDP_RIP.1.1	The TSF shall ensure that any previous information content of a resource is made unavailable upon the deallocation of the resource from the following objects: <ul style="list-style-type: none"> • authorisation data; • secret keys.

6.2.4 Trusted path/channels (FTP)

FTP_TRP.1/Local Trusted Path

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FTP_TRP.1.1/Local	The TSF shall provide a communication path between itself and local client applications that is logically distinct from other communication paths and provides assured authentication of its end points and protection of the communicated data from modification and disclosure.
FTP_TRP.1.2/Local	The TSF shall permit local client applications to initiate communication via the trusted path.
FTP_TRP.1.3/Local	The TSF shall require the use of the trusted path for accessing all services offered by the TSF through the PCIe bus or CodeSafe .

Note: Refer to [CEN EN 419221-5, Application Note 29], which states: Where the TOE and local client applications are located within the physical boundary of the same hardware appliance (e.g. local applications running on a server and communicating with a PCI card on the server's internal PCI bus) then the trusted path may be mapped in the Security Target to the physical configuration, and no additional authentication or cryptographic protection are required (because of the physical security assumed in the appliance environment).

6.2.5 Protection of the TSF (FPT)

FPT_STM.1 Reliable time stamps

Hierarchical to:	No other components
------------------	---------------------

Dependencies:	No dependencies.
FPT_STM.1.1	The TSF shall be able to provide reliable time stamps.

FPT_TST_EXT.1 Basic TSF Self Testing

Hierarchical to:	No other components
Dependencies:	No dependencies.
FPT_TST_EXT.1.1	<p>The TSF shall run a suite of the following self-tests during initial start-up (or power-on) and periodically during normal operation to demonstrate the correct operation of the TSF:</p> <ul style="list-style-type: none"> • At initial start-up (or power-on): <ul style="list-style-type: none"> ○ Software/firmware integrity test ○ Cryptographic algorithm tests ○ Random number generator tests • Periodically during normal operation: <ul style="list-style-type: none"> ○ FIPS 140-2 continuous random number generator tests ○ AIS 31 online test procedure

FPT_PHP.1 Passive detection of physical attack

Hierarchical to:	No other components
Dependencies:	No dependencies.
FPT_PHP.1.1	The TSF shall provide unambiguous detection of physical tampering that might compromise the TSF.
FPT_PHP.1.2	The TSF shall provide the capability to determine whether physical tampering with the TSF's devices or TSF's elements has occurred.

FPT_PHP.3 Resistance to physical attack

Hierarchical to:	No other components
Dependencies:	No dependencies.
FPT_PHP.3.1	The TSF shall resist physical penetration attempts to the hard opaque potted enclosure by responding automatically such that the SFRs are always enforced.

FPT_FLS.1 Failure with preservation of secure state

Hierarchical to:	No other components
Dependencies:	No dependencies.
FPT_FLS.1.1	<p>The TSF shall preserve a secure state when the following types of failures occur:</p> <ol style="list-style-type: none"> (1) Self-test according to FPT_TST_EXT.1 fails; (2) Environmental conditions are outside normal operating range (including temperature and power); (3) Failures of critical TOE hardware components (including the RNG) occurs; (4) Corruption of TOE software occurs; (5) none

6.2.6 Security Management (FMT)

FMT_SMR.1 Security roles

Hierarchical to:	No other components.
Dependencies:	FIA_UID.1 Timing of identification.
FMT_SMR.1.1	The TSF shall maintain the roles Administrator, Local Client Application , Key User, none .
FMT_SMR.1.2	The TSF shall be able to associate users with roles.

FMT_SMF.1 Security management functions

Hierarchical to:	No other components.
Dependencies:	No dependencies.
FMT_SMF.1.1	The TSF shall be capable of performing the following management functions: (1) Modifying attributes of keys; (2) Export and deletion of the audit data, which can take place only under the control of the Administrator role; (3) backup and restore functions ; (4) key import function ; (5) key export function .

Note: The requirement "(1) Unblock of access due to authentication or authorisation failures" in the PP is not applicable (refer FMT_MTD.1/Unblock) and, for readability purposes, has been removed in the ST.

FMT_MTD.1/Unblock Management of TSF data

Hierarchical to:	No other components.
Dependencies:	FMT_SMR.1 Security roles FMT_SMF.1 Specification of Management Functions
FMT_MTD.1.1/Unblock	The TSF shall restrict the ability to unblock the none to none .

Application note: The TOE does not block as a result of failed authentications, but imposes a 4 seconds delay. See FIA_AFL.1.

FMT_MTD.1/AuditLog Management of TSF data

Hierarchical to:	No other components.
Dependencies:	FMT_SMR.1 Security roles FMT_SMF.1 Specification of Management Functions
FMT_MTD.1.1/AuditLog	The TSF shall restrict the ability to control export and deletion of the audit log records to the Administrator role.

FMT_MSA.1/GenKeys Management of security attributes

Hierarchical to:	No other components.
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control] FMT_SMR.1 Security roles FMT_SMF.1 Specification of Management Functions

FMT_MSA.1.1/GenKeys	The TSF shall enforce the Key Usage SFP to restrict the ability to modify the security attributes <i>specified in the Key Attributes Modification Table</i> to <i>subjects, objects, and operations among subjects and General Keys as specified in the Key Attributes Modification Table</i> .
---------------------	---

FMT_MSA.1/AKeys Management of security attributes

Hierarchical to:	No other components.
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control] FMT_SMR.1 Security roles FMT_SMF.1 Specification of Management Functions
FMT_MSA.1.1/AKeys	The TSF shall enforce the Key Usage SFP to restrict the ability to modify the security attributes <i>specified in the Key Attributes Modification Table</i> to <i>subjects, objects, and operations among subjects and Assigned Keys as specified in the Key Attributes Modification Table</i> .

Key Attribute (MSA.1)	Assigned Key	General Key
Key ID	Cannot be modified	Cannot be modified
Key type	Cannot be modified	Cannot be modified
Authorisation data	For Token protected keys: Modified only when modification operation includes successful validation of current (pre-modification) authorisation data. For Certifier protected keys: cannot be modified.	Modified only when modification operation includes successful validation of current (pre-modification) authorisation data, or by an Administrator
Re-authorisation conditions	Cannot be modified	-
Key usage	Cannot be modified	-
Export flag	Cannot be modified	-
Assigned flag	Cannot be modified	Can be modified only by Administrator, and only to change from non-assigned to assigned Cannot be modified
Integrity protection data	Cannot be modified by users (maintained automatically by TSF)	Cannot be modified by users (maintained automatically by TSF)

Table 3 Key Attributes Modification Table

FMT_MSA.3/Keys Static attribute initialisation

Hierarchical to:	No other components.
Dependencies:	FMT_MSA.1 Management of security attributes FMT_SMR.1 Security roles

FMT_MSA.3.1/Keys	The TSF shall enforce the Key Usage SFP to provide restrictive default values for security attributes that are used to enforce the SFP.
FMT_MSA.3.2/Keys	The TSF shall allow the authorised identified roles, according to the constraints in the Key Attributes Initialisation Table to specify alternative initial values to override the default values when an object or information is created.

Key Attribute (MSA.1)	Assigned Key	General Key
Key ID	Initialised by generation process	Initialised by generation process
Key type	Initialised by generation process	Initialised by generation process
Authorisation data	Initialised by creator during generation	Initialised by creator during generation
Re-authorisation conditions	Initialised by Administrator during generation	-
Key usage	Initialised by creator during generation	-
Export flag	False (i.e. no export allowed)	-
Assigned flag	Initialised by generation process	Non-assigned
Integrity protection data	Initialised automatically by TSF	Initialised automatically by TSF

Table 4 Key Attributes Initialisation Table

6.2.7 Security Audit Data Generation (FAU)

FAU_GEN.1 Audit data generation

Hierarchical to:	No other components.
Dependencies:	FPT_STM.1 Reliable time stamps
FAU_GEN.1.1	<p>The TSF shall be able to generate an audit record of the following auditable events:</p> <ul style="list-style-type: none"> a) Start-up and shutdown of the audit functions; b) All auditable events for the not specified level of audit; and c) Startup of the TOE; d) Shutdown of the TOE; e) Cryptographic key generation (FCS_CKM.1); f) Cryptographic key destruction (FCS_CKM.4); g) Failure of the random number generator (FCS_RNG.1); h) Authentication and authorisation failure handling (FIA_AFL.1): all unsuccessful authentication or authorisation attempts, the reaching of the threshold for the unsuccessful authentication or authorisation attempts and the blocking actions taken; i) All attempts to import or export keys (FDP_IFF.1/KeyBasics); j) All modifications to attributes of keys (FDP_ACF.1/KeyUsage, FMT_MSA.1/GenKeys and FMT_MSA.1/AKeys); k) Backup and restore (FDP_ACF.1/Backup): use of any backup function, use of any restore function, unsuccessful restore because of detection of modification of the backup data;

	<p>l) Integrity errors detected for keys (FDP_SDI.2);</p> <p>m) Failures to establish secure channels (FTP_TRP.1/Local, FTP_TRP.1/External);</p> <p>n) Self-test completion (FPT_TST_EXT.1);</p> <p>o) Failures detected by the TOE (FPT_FLS.1);</p> <p>p) All administrative actions (FMT_SMF.1, FMT_MSA.1 (all iterations), FMT_MSA.3/Keys);</p> <p>q) Unblocking of access (FMT_MTD.1/Unblock);</p> <p>r) Modifications to audit parameters (affecting the content of the audit log) (FAU_GEN.1);</p> <p>s) none.</p>
FAU_GEN.1.2	<p>The TSF shall record within each audit record at least the following information:</p> <p>a) Date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event; and</p> <p>b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST: none.</p>

FAU_GEN.2 User identity association

Hierarchical to:	No other components.
Dependencies:	FAU_GEN.1 Audit data generation FIA_UID.1 Timing of identification
FAU_GEN.2.1	For audit events resulting from actions of identified users, the TSF shall be able to associate each auditable event with the identity of the user that caused the event.

FAU_STG.2 Guarantees of audit data availability

Hierarchical to:	FAU_STG.1 Protected audit trail storage
Dependencies:	FAU_GEN.1 Audit data generation
FAU_STG.2.1	The TSF shall protect the stored audit records in the audit trail from unauthorised deletion.
FAU_STG.2.2	The TSF shall be able to detect unauthorised modifications to the stored audit records in the audit trail.
FAU_STG.2.3	The TSF shall ensure that all stored audit records will be maintained when the following conditions occur: audit storage exhaustion.

6.3 Security Assurance Requirements

The security assurance requirement level is EAL4 augmented with AVA_VAN.5 as required by [CEN EN 419221-5, section 6.4]. Additionally, this Security Target augments the assurance requirements with ALC_FLR.2.

The refinements made to the SARs can be found in [CEN EN 419221-5, section 6.4.1].

7 TOE Summary Specification

This section provides a summary of how the TOE meets the SFRs.

For readability, closely related SFRs are grouped in Security Functions provided by the TOE, and a description of the Security Functions is provided.

7.1 Key management

Key attributes

The TOE maintains an Access Control List (ACL) associated with a key. ACLs are ordered lists of permission groups, which consists of one or more actions, and optionally restrictions.

The ACL of a private / secret key is specified at key generation and the TOE will enforce restrictive default values, meaning that if a certain value or restriction is not specified, the TOE will assume the restrictive value.

When secret / private keys are generated according to the TOE guidance documentation, the requirements in the Key Usage SFP and the Key Basics SFP are enforced. In this way, the concept of Assigned Key is enforced by the TOE with a very specific ACL configuration, instead of a dedicated *Assigned Key* flag. The Assigned Key ACL configuration enforces that:

- The ACL is non-modifiable,
- The key cannot be exported or used in a key derivation operation,
- The key is non-recoverable.

Key generation

The TOE provides key generation functions using the on board FIPS 140-2 Level 3 and AIS 31 compliant Random Number Generator.

When a new key pair is generated, the TOE also generates a signed key generation certificate, which contains information about the ACL, hash of the key, and key generation parameters. This way, public keys are exported with integrity protection of their key value and attributes, as required by FDP_IFF.1.2/KeyBasics (2).

Key storage and backup

Keys are stored in a secure container, a Key Blob, which is under the control of the TOE and ensures the confidentiality and integrity of the key and ACL.

The TOE supports the following backup operations:

- "*backup create*" by creating a new Security World,
- "*backup restore*" by loading an already existing Security World into an HSM.

Key import and export

Keys can be exported only if allowed by the key ACL.

The ACL configuration for Assigned Keys explicitly disables key export. The ACL configuration for General Keys allows export only in encrypted form.

Only General keys can be imported. General keys can only be imported in encrypted form.

Note: key export means that the key is no longer under the exclusive control of the TOE, as opposed to external storage and backup, in which the keys remain under exclusive control of the TOE.

Key destruction

Internal keys are deallocated by overwriting the object in volatile memory with a zero-bit pattern.

Module keys in persistent storage are zeroized with zero-bit pattern or random data.

7.2 Authorisation

The TOE protects keys and sensitive functions from unauthorised access.

The Administrator role is undertaken by holders of the Administrator Card Set (ACS). Administrative functions require a quorum of Administrator Card Set (ACS) with passphrases presented to the TOE.

The Key User role is represented by owners of application keys, e.g. Signing keys.

Use of a key, e.g. for signing or encryption, requires one of the following:

- For token protected secret keys, a quorum of Operator Card Set (OCS) or a Softcard with passphrases presented to the TOE.
- For certifier protected secret keys, the Certifier Key specified in the Access Control List (ACL) of the secret key must be loaded in the TOE.

In case of failed attempt to load a token from a smartcard or softcard with a passphrase, the TOE enforces a 4 seconds delay to prevent brute force attacks.

Token protected keys support time and use limits imposed in the ACL of the key. Authorisation to use a key can be removed by deallocating the key handle through the Cmd_Destroy call.

Local client applications can be of two types:

- Local client application residing within the same hardware appliance boundary, e.g. an nShield Connect network appliance or a server, and communicating with the TOE through the PCIe bus.
- Embedded local client application, executing inside the TOE's tamper protected boundary using Codesafe.

As described in [CEN EN 419221-5, FTP_TRP.1/Local] and [CEN EN 419221-5, Application Note 29], the authentication of local clients applications is ensured by the physical boundary of the hardware appliance.

7.3 Cryptographic functions

The TOE provides a wide range of cryptographic functions available to applications through the nCore API. Refer to FCS_COP.1 for a detailed list of algorithms.

7.4 Random number generation

The random number generator used by the Solo XC HSM is composed of two main blocks:

- A deterministic RNG providing 256 bits of security, compliant with NIST SP 800-90A Hash-based DRBG and DRG.4
- A physical true RNG compliant with PTG.2, which provides entropy input to seed the deterministic RNG.

Only random numbers output from the deterministic RNG are used by the TOE for a variety of functions, mainly key generation, random values such as IVs, nonces and random number generation service provided by the nCore API to external applications.

7.5 Audit

The TOE is configured to generate audit logs of all the relevant events specified in FAU_GEN.1.1. The on board Real Time Clock (RTC) is used to provide the log timestamp. This RTC is also available through the API as a service to other timestamping applications.

The TOE does not store audit logs persistently. Once the audit function is enabled by the Administrators during TOE initial configuration, the log entries are asynchronously and automatically sent to the Hardserver, without any further human intervention. It is the responsibility of the hardserver to send the audit logs to a Syslog server.

The TOE uses the same memory buffer to queue log entries to be sent to the Hardserver and incoming commands, and the TOE throttles inputs if required, preventing exhaustion of the internal/temporary buffers.

The TOE maintains an audit signing key pair which is used to sign the audit trail Signature Blocks. The public key is available to external parties for verification of the audit trail integrity and origin.

7.6 Physical protection

The TOE is enclosed in a hard opaque potting enclosure, meeting FIPS 140-2 level 3 physical requirements, to protect itself against physical attacks.

7.7 Self tests

The TOE implements self-tests and monitoring capabilities to ensure it is operating securely.

At Power-up

- Firmware integrity verification.
- AES encryption and decryption Known Answer Test
- AES CMAC Known Answer Test
- Triple-DES encryption and decryption Known Answer Test
- Triple-DES CBC-MAC Known Answer Test
- DSA signature generation and verification Known Answer Test
- ECDSA signature generation and verification pair-wise consistency test
- RSA signature generation and verification Known Answer Test
- RSA encryption and decryption Known Answer Test
- HMAC-SHA-1, HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, HMAC-SHA-512 Known Answer Test
- Primitive "Z" for Diffie-Hellman Known Answer Test
- Primitive "Z" for EC Diffie-Hellman and EC MQV Known Answer Test
- KDF in CTR mode Known Answer Test

- DRBG Known Answer Test
- SHA-1 Known Answer Test
- Statistical tests on the entropy source (poker, monobit, runs and long runs tests)

During normal operation

- Voltage and temperature monitoring, which trigger a tamper response in the case of out of range values.
- AIS 31 online and total failure tests on the physical true RNG.
- FIPS 140-2 continuous random number generator tests on the physical true RNG and the deterministic RNG (DRBG).

7.8 Secure channels

In line with the PP interpretation, the local trusted path is provided by the hardware appliance boundary, which encloses the TOE and the local client application. Depending on the configuration, the hardware appliance can be an nShield Connect XC or a host server/PC. The following cases are considered:

- TOE in Connect configuration. In this case, the TOE and the Hardserver application are both located inside the Connect appliance boundary, and communicate through the PCIe bus.
- TOE in host server configuration. In this case, the TOE and application are located inside the host server appliance boundary, and communicate through the PCIe bus.
- In both configurations, the TOE supports CodeSafe applications, which run within the TOE's physical boundary and communicate with the TOE using an internal API.

7.9 Mapping between Security Functions and SFRs

	Audit	Authorisation	Key management	Physical protection	Self tests	Secure channels	Cryptographic functions	Random number generation

8 Rationales

8.1 Security Objectives Rationale

8.1.1 Security Objectives Coverage

The table below shows the mapping of Threats, Organisational Security Policies and Assumptions to Security Objectives for the TOE and for the TOE Environment.

	OT.PlainKeyConf	OT.Algorithms	OT.KeyIntegrity	OT.Auth	OT.KeyUseConstraint	OT.KeyScope	OT.DataConf	OT.DataMod	OT.ImportExport	OT.Backup	OT.RNG	OT.TamperDetect	OT.FailureDetect	OT.Audit	OE.ExternalData	OE.Env	OE.DataContext	OE.AppSupport	OE.Uauth	OE.AuditSupport
T.Key Disclosure	X		X				X		X	X		X			X	X				
T.Key Derive		X									X									
T.Key Mod			X						X	X		X								
T.Key Misuse				X	X															
T.Key Overuse						X														
T.Data Disclosure							X										X	X		
T.Data Mod								X									X	X		

Threats

T.KeyDisclose is addressed by the requirement in OT.PlainKeyConf to keep plaintext secret keys unavailable, and this is supported in terms of controls over key attributes (which might threaten the confidentiality of the key if modified) in OT.KeyIntegrity. The confidentiality of secret keys that are exported is protected partly by the use of a secure channel as described in OT.DataConf and the requirements for import and export in OT.ImportExport (including the requirement to export secret keys only in encrypted form, or to be able to exclude the export of a key entirely). Physical tamper protection of the keys is provided by OT.TamperDetect (supported by an appropriate inspection procedure as required in OE.Env). Protection of secret key confidentiality during backup is ensured by OT.Backup. The environment also contributes to maintaining secret key confidentiality by protecting any versions of a secret key that may exist outside the TOE, as in OE.ExternalData, and by protecting the operation of the TOE itself by providing a secure environment, as in OE.Env.

T.KeyDerive is addressed by the choice of algorithms that have been endorsed for the appropriate purposes, and this is described in OT.Algorithms. Where keys are generated by the TOE then the use of a suitable random number generator is required by OT.RNG in order to mitigate the risk that an attacker can guess or deduce the key value.

T.KeyMod is addressed by requiring integrity protection of secret and public keys, and their critical attributes in OT.KeyIntegrity, and by requiring use of secure channels that protect integrity if a key is imported or exported (OT.ImportExport). Protection of key integrity during backup is ensured by OT.Backup. Physical tamper protection of the keys is provided by OT.TamperDetect (supported by an appropriate inspection procedure as required in OE.Env).

T.KeyMisuse raises the possibility of a secret key being used for an unintended and unauthorised purpose, and is addressed by the requirement in OT.Auth for the TOE to carry out an authorisation check before using a secret key. OT.KeyUseConstraint expands on this to set out requirements for the granularity of authorisation.

T.KeyOveruse is concerned with the possibility that more uses may be made of an authorised key than were intended, and this is addressed by the requirements of OT.KeyUseScope which requires controls to be specified and enforced for any re-authorisation conditions that the TOE allows a user to define.

T.DataDisclose is concerned with the transmission of data between client applications and the TOE, ~~or between separate parts of the TOE where the transmission passes through an insecure environment.~~ This is addressed by OT.DataConf, which requires the TOE to provide secure channels to protect such communications. The appropriate use of such channels is a requirement for the environment as expressed in OE.DataContext, as is the use of appropriate procedures in OE.AppSupport.

T.DataMod is concerned with the possibility of unauthorised modification of data transmitted between a client application and the TOE, and this is addressed by OT.DataMod which requires that the TOE provides secure channels that can be used to protect the integrity of data that they carry. As with T.DataDisclose, the appropriate use of such channels is a requirement for the environment as expressed in OE.DataContext, as is the use of appropriate procedures in OE.AppSupport.

T.Malfunction is addressed by the requirement in OT.FailureDetect for the TOE to detect certain types of fault.

Organisation Security Policies

P.Algorithms requires the use of key generation and other cryptographic functions that are endorsed by appropriate authorities, and this is addressed by OT.Algorithms.

P.KeyControl requires that the TOE can provide controls and support a key lifecycle to ensure that secret keys can be reliably protected against use by those other than the owner of the key, and that the keys can be confined to use for certain cryptographic functions. This is addressed by a combination of TOE objectives as follows:

- OT.PlainKeyConf protects the value of the secret key to prevent the possibility of it being used by unauthorised subjects
- OT.Algorithms ensures that endorsed algorithms that employ and support suitable properties and procedures are provided by the TOE
- OT.Auth, OT.KeyUseConstraint and OT.KeyUseScope ensure that the TOE can provide well-defined limits on the use of a key when it is authorised (as described above for T.KeyMisuse and T.KeyOveruse)
- OT.ImportExport and OT.Backup ensure protection of keys when they are transmitted outside the TOE to client applications or for backup purposes, including the prevention of export of Assigned Keys.

P.Audit requires the TOE to provide an audit trail and this is addressed directly by OT.Audit (which includes protection of the audit records).

Assumptions

Each of the Assumptions is directly matched by a Security Objective for the operational environment. The wording of each objective for the operational environment includes the wording of each assumption, and no further rationale is therefore given here.

8.2 Security Requirements Rationale

8.2.1 Security Requirements Coverage

The table below summarises the mapping of Security Objectives for the TOE to SFRs.

	OT.PlainKeyConf	OT.Algorithms	OT.KeyIntegrity	OT.Auth	OT.KeyUseConstraint	OT.KeyUseScope	OT.DataConf	OT.DataMod	OT.ImportExport	OT.Backup	OT.RNG	OT.TamperDetect	OT.FailureDetect	OT.Audit
FCS_CKM.1		X												
FCS_CKM.4	X													
FCS_COP.1		X												
FCS_RNG.1/PTRNG											X			
FCS_RNG.1/DRBG											X			
FIA_UID.1				X										
FIA_UAU.1				X										

FIA_AFL.1				X										
FIA_UAU.6/KeyAuth_Token				X		X								
FIA_UAU.6/KeyAuth_CertifierKey				X		X								
FDP_IFC.1/KeyBasics	X				X				X					
FDP_IFF.1/KeyBasics	X		X		X				X					
FDP_ACC.1/KeyUsage					X	X								
FDP_ACF.1/KeyUsage					X	X								
FDP_ACC.1/Backup										X				
FDP_ACF.1/Backup										X				
FDP_SDI.2			X											
FDP_RIP.1	X				X									
FTP_TRP.1/Local			X	X			X	X	X					
FTP_TRP.1/External			X	X			X	X	X					
FPT_STM.1														X
FPT_TST_EXT.1													X	
FPT_PHP.1										X				
FPT_PHP.3										X				
FPT_FLS.1												X		
FMT_SMR.1				X										X
FMT_SMF.1				X										X

OT.DataConf is addressed by the authentication and confidentiality requirements for secure channels in FTP_TRP.1/Local.

OT.DataMod is addressed by the authentication and integrity requirements for secure channels in FTP_TRP.1/Local.

OT.ImportExport is addressed by the requirements for the use of secure import/export through a secure channel and restrictions on how keys are imported and exported to protect confidentiality and integrity in the Key Basics SFP in FDP_IFC.1/KeyBasics and FDP_IFF.1/KeyBasics, and by the requirements on the secure channels themselves in FTP_TRP.1/Local.

OT.Backup separates out the requirements for any backup and restore properties that the TOE may provide and is addressed directly by the Backup SFP in FDP_ACC.1/Backup and FDP_ACF.1/Backup.

OT.RNG is addressed by the requirement in FCS_RNG.1/PTRNG and FCS_RNG.1/DRBG for a true physical random number generator and deterministic random bit generator which meet AIS 31 PTG.2 and DRG.4 classes.

OT.TamperDetect is addressed by the requirement for passive tamper detection in FPT_PHP.1 and the tamper response mechanisms in FPT_PHP.3.

OT.FailureDetect is addressed by the self-test requirements of FPT_TST_EXT.1 and secure failure requirements of FPT_FLS.1.

OT.Audit is addressed in terms of basic creation of audit records by the requirements for audit record generation in FAU_GEN.1 and FAU_GEN.2 and provision of timestamps for use in audit records in FPT_STM.1. Protection of the audit trail is ensured by FAU_STG.2, FMT_MTD.1/AuditLog and FMT_SMF.1. Support for the Administrator role that controls export and deletion of audit records from the TOE is required by FMT_SMR.1.

8.2.3 SFR Dependencies

The dependencies between SFRs are addressed as shown in the following Table. Where a dependency is not met in the manner defined in [CC2] then a rationale is provided for why the dependency is unnecessary or else met in some other way.

Requirement	Dependencies	Fulfilled by
FCS_CKM.1	[FCS_CKM.2 or FCS_COP.1] FCS_CKM.4	FCS_COP.1 FCS_CKM.4
FCS_CKM.4	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	FCS_CKM.1 See also note below on key attributes during import or export.
FCS_COP.1	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1] FCS_CKM.4	FCS_CKM.1 FCS_CKM.4 See also note below on key attributes during import or export.
FCS_RNG.1/PTRNG	No dependencies	--

FCS_RNG.1/DRBG		
FIA_UID.1	No dependencies	--
FIA_UAU.1	FIA_UID.1	FIA_UID.1
FIA_AFL.1	FIA_UAU.1	FIA_UAU.1
FIA_UAU.6/KeyAuth_Token FIA_UAU.6/KeyAuth_Certifier	No dependencies	--
FDP_IFC.1/KeyBasics	FDP_IFF.1	FDP_IFF.1/KeyBasics
FDP_IFF.1/KeyBasics	FDP_IFC.1 FMT_MSA.3	FDP_IFC.1/KeyBasics FMT_MSA.3/Keys
FDP_ACC.1/KeyUsage	FDP_ACF.1	FDP_ACF.1/KeyUsage
FDP_ACF.1/KeyUsage	FDP_ACC.1 FMT_MSA.3	FDP_ACC.1/KeyUsage FMT_MSA.3/Keys
FDP_ACC.1/Backup	FDP_ACF.1	FDP_ACF.1/Backup
FDP_ACF.1/Backup	FDP_ACC.1 FMT_MSA.3	FDP_ACC.1/Backup The dependency on FMT_MSA.3 is not relevant in this case since the attribute used in FDP_ACF.1/Backup is determined by the ability of the user to authenticate as an administrator according to FIA_UAU.1.
FDP_SDI.2	No dependencies	--
FDP_RIP.1	No dependencies	--
FTP_TRP.1/Local	No dependencies	--
FTP_TRP.1/External	No dependencies	--
FPT_STM.1	No dependencies	--
FPT_TST_EXT.1	No dependencies	--
FPT_FLS.1	No dependencies	--
FMT_SMR.1	FIA_UID.1	FIA_UID.1
FMT_SMF.1	No dependencies	--

FMT_MTD.1/Unblock	FMT_SMR.1 FMT_SMF.1	FMT_SMR.1 FMT_SMF.1
FMT_MTD.1/AuditLog	FMT_SMR.1 FMT_SMF.1	FMT_SMR.1 FMT_SMF.1
FMT_MSA.1/GenKeys	[FDP_ACC.1 or FDP_IFC.1] FMT_SMR.1 FMT_SMF.1	FDP_ACC.1/KeyUsage FDP_IFC.1/KeyBasics FMT_SMR.1 FMT_SMF.1
FMT_MSA.1/AKeys	[FDP_ACC.1 or FDP_IFC.1] FMT_SMR.1 FMT_SMF.1	FDP_ACC.1/KeyUsage FDP_IFC.1/KeyBasics FMT_SMR.1 FMT_SMF.1
FMT_MSA.3/Keys	FMT_MSA.1 FMT_SMR.1	FMT_MSA.1/GenKeys, FMT_MSA.1/AKeys FMT_SMR.1
FAU_GEN.1	FPT_STM.1	FPT_STM.1
FAU_GEN.2	FAU_GEN.1 FIA_UID.1	FAU_GEN.1 FIA_UID.1
FAU_STG.2	FAU_GEN.1	FAU_GEN.1

Table 7 SFR Dependencies Rationale

8.2.4 Rationale for SARs

The assurance level for this protection profile is **EAL4 augmented with AVA_VAN.5 and ALC_FLR.2**.

EAL4 allows a developer to attain a reasonably high assurance level without the need for highly specialised processes and practices. It is considered to be the highest level that could be applied to an existing product line without undue expense and complexity. As such, EAL4 is appropriate for commercial products that can be applied to moderate to high security functions.

The TOE described in this protection profile is just such a product. Augmentation results from:

- the selection of **AVA_VAN.5**. All the dependencies of AVA_VAN.5 are satisfied by other assurance components in the EAL4 assurance package

- the selection of **ALC_FLR.2**, which has no dependencies

8.2.5 AVA_VAN.5 Advanced methodical vulnerability analysis

The TOE generates uses and manages the highly sensitive data in the form of secret keys, at least some of which may be used as signature creation data. The protection of these keys and associated security of their attributes and use in cryptographic operations can only be ensured by the TOE itself. While the TOE environment is intended to protect against physical attacks, a high level of protection against logical attacks (especially those that might be carried out remotely) is also necessary, and is therefore addressed by augmenting vulnerability analysis to deal with High attack potential.

8.2.6 ALC_FLR.2 Flaw reporting procedures

Provides assurance that nCipher Security have a well-defined processes and a proactive posture to act upon security vulnerabilities found in the field.

10 Terminology

For the purposes of this document, the acronyms, terms and definitions given in [CEN EN 419221-5] apply.

Common Criteria terms and definitions are given in [CC1].

Additional terms defined for the purposes of this document are listed below.

Term	Definition
ACS	Administrator Card Set - a set of smart cards used to control access to Administration functions.
OCS	Operator Card Set – a set of smart cards used to control access to keys.
Softcard	A logical token that is protected by a passphrase.
Hardserver	The nShield server software running on the nShield Connect XC or host server/PC in which the TOE is installed. It performs the following functions: <ul style="list-style-type: none">• Command and reply translation between the clients and the HSM,• Forward log entries to a Syslog server for persistent storage.
Impath	Inter-module path. An nCipher proprietary secure protocol between two Hardserver instances.
Key blob	Key blobs (also known as Application Key Tokens) provide a mechanism for securely storing a key and ACL on insecure media. They provide both confidentiality and integrity. Key blobs can be stored externally of the TOE or internally in non-volatile memory.
Logical token	A logical token is a symmetric key used exclusively for the purpose of protecting other keys. They can be split into Shares using a quorum system based on Shamir's Secret Sharing algorithm which allows reassembly of a logical token using any k of a total of n shares (these values being chosen when the logical token is created). Each Share is stored encrypted on a smartcard or softcard, protected with a passphrase.
Token protected key	A key stored in a Key blob which is protected by a Logical Token and the TOE's Module key. The Logical Token needs to be loaded from a Softcard or an OCS quorum to unlock the use of this key.
Certifier key	A key that is required to unlock the use of a Certifier protected key.
Certifier protected key	A key stored in a Key blob which is protected by the TOE's Module key. The ACL of the key requires a Certifier key to be loaded in the TOE to unlock the use of this key.
ACL	Access Control List. An ordered list of permission groups, which consists of one or more actions, and optionally restrictions.
Module key	Symmetric key stored inside the TOE which is used for Key Blob protection.
CodeSafe application	An embedded application running in the protected environment of the HSM. The CodeSafe application is sandboxed and does not have access to key material loaded into the HSM except through the same APIs, satisfying the same access

	controls, as applications that call the HSM from the host side.
NFKM	A Security World API that can be used manage keys, cardsets and softcards
qSCD	Qualified Signature (or Seal) Creation Device
TVD	Trusted Verification Device, a card reader for secure remote presentation of smartcards to the HSM.

ABOUT ENTRUST CORPORATION

Entrust keeps the world moving safely by enabling trusted identities, payments and data protection. Today more than ever, people demand seamless, secure experiences, whether they're crossing borders, making a purchase, accessing e-government services or logging into corporate networks. Entrust offers an unmatched breadth of digital security and credential issuance solutions at the very heart of all these interactions. With more than 2,500 colleagues, a network of global partners, and customers in over 150 countries, it's no wonder the world's most entrusted organizations trust us.

ENTRUST

SECURING A WORLD IN MOTION
